Wiring Adaptation Module

OCP Telco Engineering Workshop 09.25.2017

Sumithra Bhojan
Principal Member of Tech Staff
AT&T
Overview

Open design wiring adaptation module complements the design option under AT&T’s 16 port G.fast ODPU spec

The module comprising of the connectivity options and RPF functionalities agnostic to the DPU and their G.fast silicon adds modular flexibility when deploying G.fast over different cable options

Enables use of a single DPU SKU either for twisted pair or coax deployment scenarios including DTA (iDTA and cDTA) implementation

DPU OEM and silicon agnostic external modular solution
Module Function

- Connectivity between a twisted pair DPU and CPEs (coax or twisted pair)
- Wiring adaptation modules are connected to the ODPU using a common connector.
- Media converter from twisted pair to coax.
- Power splitting function able to support SR2 or SR3 class RPF.
- Media adapter from twisted pair to P2P CAT3/5 cables.
- Add triplexer functionality to the module.
Benefits

Use of single G.fast DPU SKU
Drastically reduces installation/wiring time when triplexers are used
Reduced OPEX cost for repair and installation
Faster hardware migration for upgrades
