OCP Baseline Hardware Management (Redfish Profile) v1.0.0
1 Scope

This document defines the baseline hardware management Redfish model to remotely manage platforms and devices in Open Compute Project. Other OCP projects may reference this specification and extend it to comprehend the projects specific requirements.

This document was prepared by the OCP Hardware Management project.

4 Overview

Scalability in today’s data center is increasingly achieved with horizontal, scale-out solutions, which often include large quantities of simple servers. The usage model of scale-out hardware is drastically different than that of traditional enterprise platforms, and requires a new approach to management.

Designed to meet the expectations of end users for simple and secure management of modern scalable platform hardware, DMTF’s Redfish® is an open industry standard specification and schema that specifies a RESTful interface and utilizes JSON and OData to help customers integrate solutions within their existing tool chains. An aggressive development schedule is quickly advancing Redfish toward its goal of addressing all the components in the data center with a consistent API. (dmtf.org/redfish)

5 Introduction

5.1 Reference Documents

Redfish Whitepaper (DSP2044 v1.0.2, June 2017)

Redfish Scalable Platforms API Specification (DSP0266 v1.4.0, Dec 2017).

Redfish Schema (DSP8010 v2017.3, Dec 2017)

Redfish Interoperability Profiles Specification (DSP0272 v1.0.0, Jan 2018)

5.2 Redfish

The Redfish Scalable Platforms Management API ("Redfish") is a standard that uses RESTful interface semantics to access data defined in model format to perform systems management. It is suitable for a wide range of servers, from stand-alone servers to rack mount and bladed environments but scales equally well for large scale cloud environments.

5.3 Redfish Profile Format

The Redfish Interoperability Profile is a JSON document which contains Schema-level, Property-level, and Registry-level requirements. A Redfish Profile file provides a machine readable file for prescriptive requirements on an implementation.

In the Profile JSON file, the requirements are expressed as the value to the ReadRequirement, WriteRequirement, and ConditionalRequirement properties.

The value of the ReadRequirement and WriteRequirement properties can be:

- Mandatory – must be present
- Recommended – optional and recommended, and may be mandatory in the future
- IfImplemented – must be present, if the managed entity is implemented

The ConditionalRequirement property specifies more complex conditions on the existence of a property.

6 Redfish Profile for OCP Hardware Management Baseline

The OCP Hardware Management Baseline is specified in this document.

The figure below shows the resources for which the OCP Hardware Management Baseline imposes requirements.
The subsequent sections specifies the requirements per resource. Each section has a mockup, which shows the properties of the resource and the properties that have requirements, which are specified in a subsequent table.

(The mockups include a superset of properties for a resource. The properties which have a requirement in this document are bold-faced. This provides context, during of this document, for decisions on whether additional (or fewer) requirements should be stated in this document.)

The Redfish Profile file which expresses these same requirements can be found in section 6.

6.1 Service Root resource

The ServiceRoot resource shall exists.

Figure 1 shows a mockup of the ServiceRoot resource. The properties in bold have requirements, which are specified in Table 1.

{

7 OCPBaselineHardwareManagement JSON file

Redfish specifies that format of a 'profile' file which express the prescriptive requirements of Redfish resources. The profile file can be read by the Redfish Interoperability Tool, with will run a series of conformance tests against an implementation. This can be used to verify the conformance of the implementation to the profile.

See the OCPBaselineHardwareManagement.1_0_0.json file.
