Power Up Sequency

1. Bring up OVDD, LVDD, BVDD, CVDD, and USB_VDD_3P3.

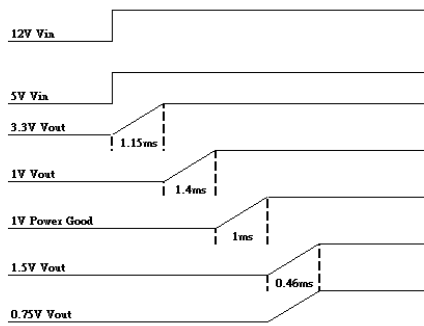

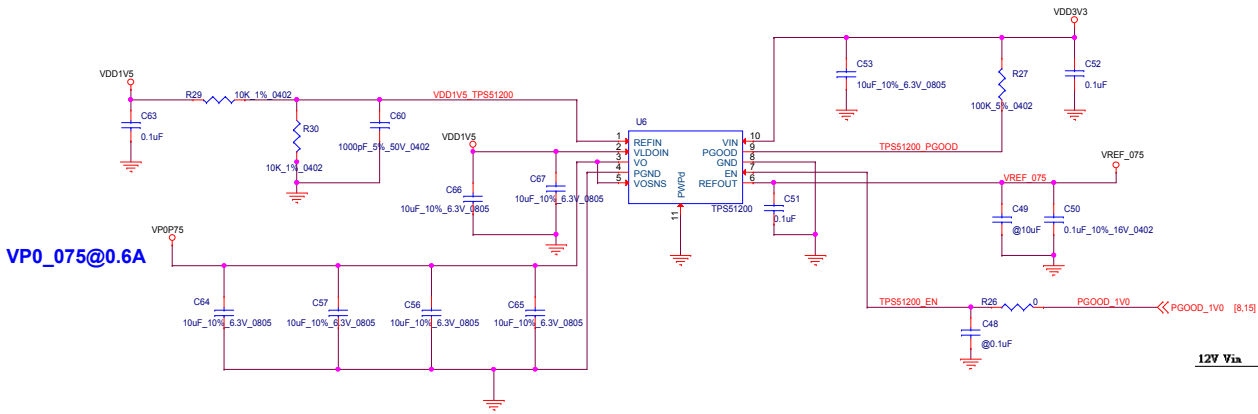

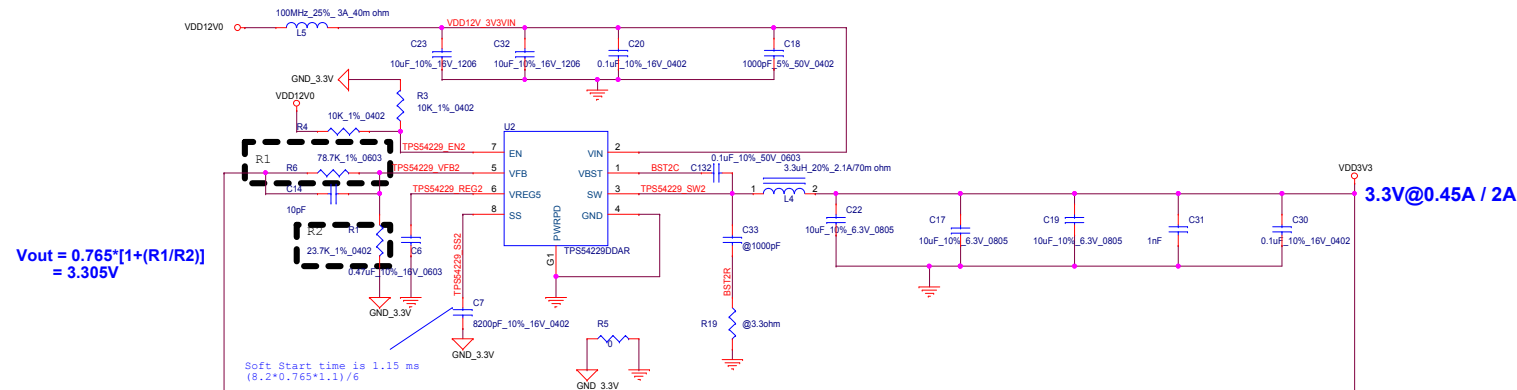

<< 3.3V

2. Bring up VDD_CA_CB_PL, SVDD, AVDD, and USB_VDD_1P0.

<< 1.0V

3. Bring up GVDD(DDR) and XVDD.

<< 1.5V

- 2.2 Power Up Sequencing
- The device requires that its power rails be applied in a specific sequence in order to ensure proper device operation. These requirements are as follows for power up:
1. Bring up OV_{DD}, LV_{DD}, BV_{DD}, CV_{DD}, and USB_V_{DD}_3P3. Drive POV_{DD} = GND.

— PORESET input must be driven asserted and held during this step.

— IO_VSEL inputs must be driven during this step and held stable during normal operation.

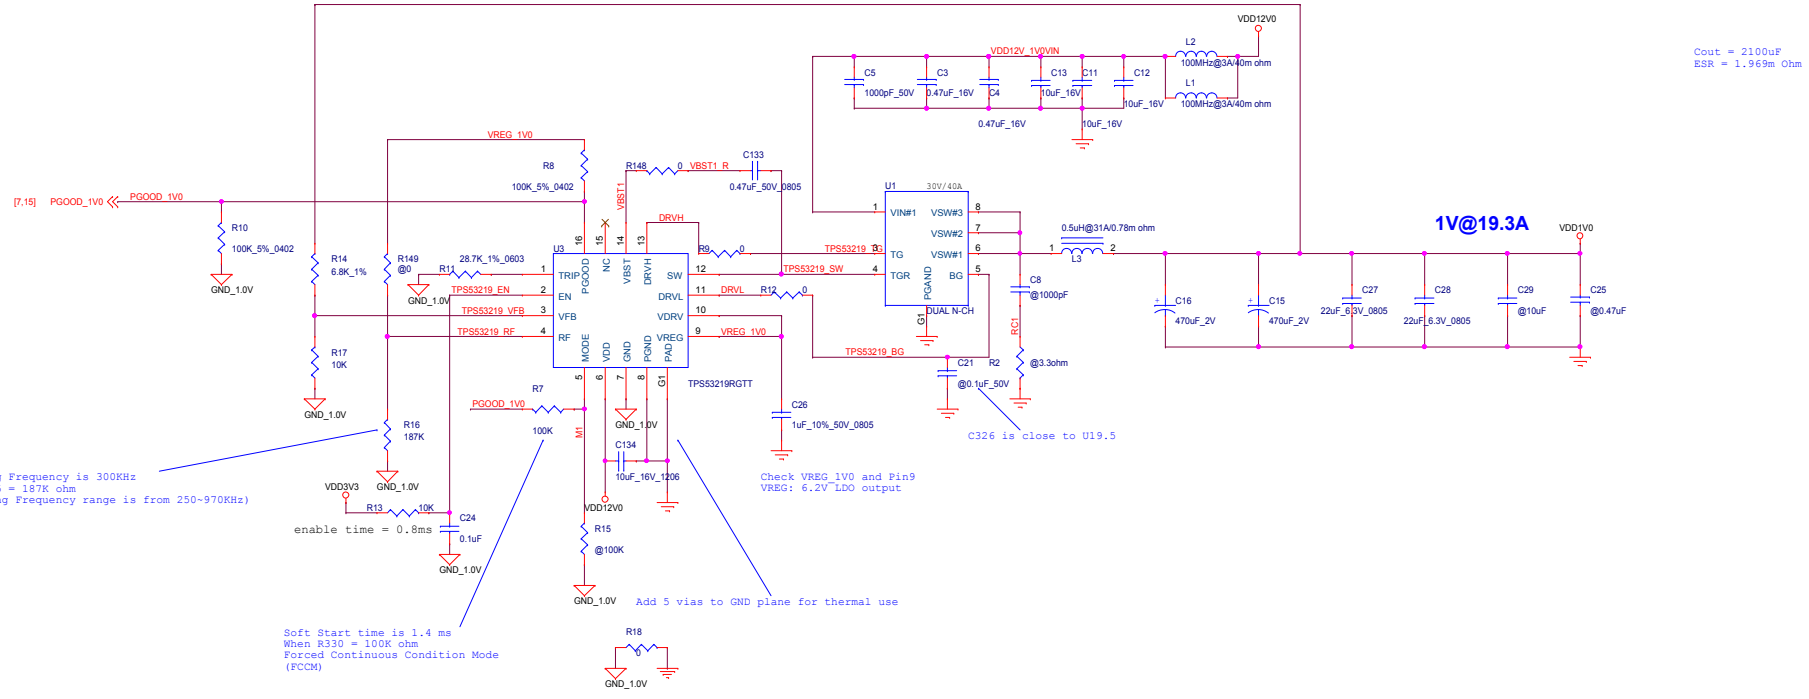

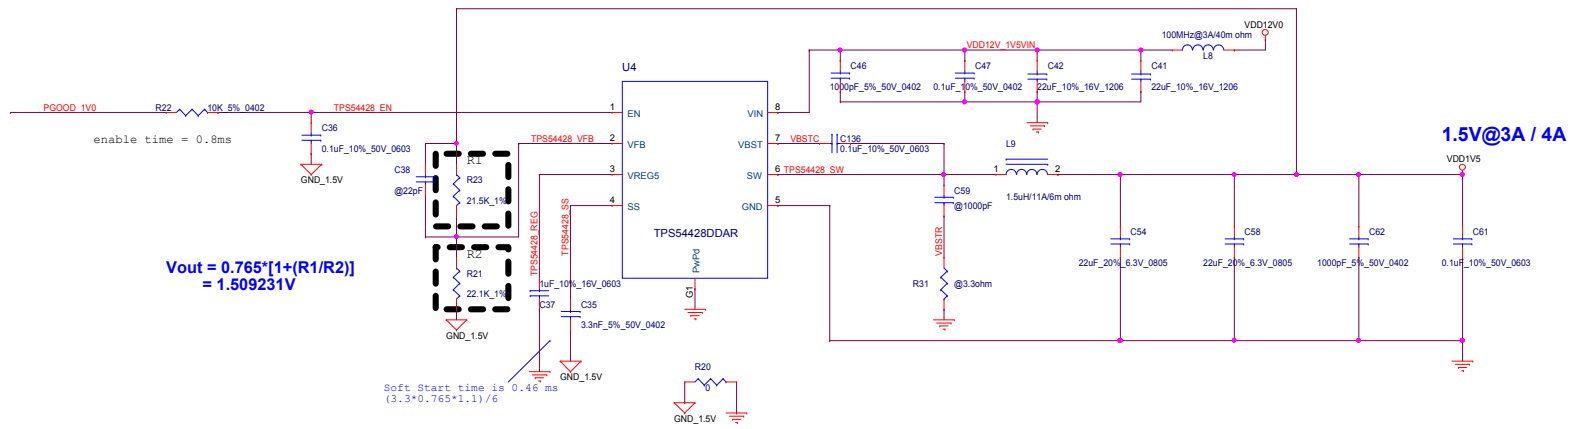

— USB_V_{DD}_3P3 rise time (10% to 90%) has a minimum of 350 μs.

2. Bring up V_{DD}_CA_CB_PL, SV_{DD}, AV_{DD} (cores, platform, SerDes) and USB_V_{DD}_1P0. V_{DD}_CA_CB_PL and USB_V_{DD}_1P0 must be ramped up simultaneously.

3. Bring up GV_{DD} (DDR) and XV_{DD}.

4. Negate PORESET input as long as the required assertion/hold time has been met per Table 16.

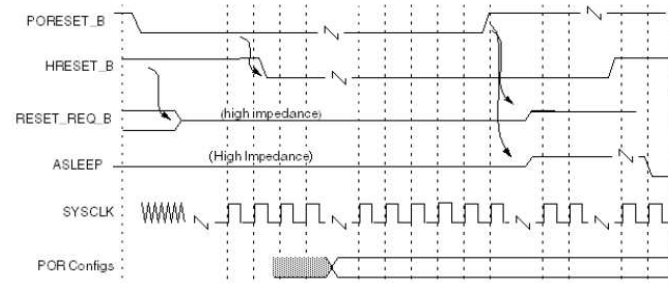

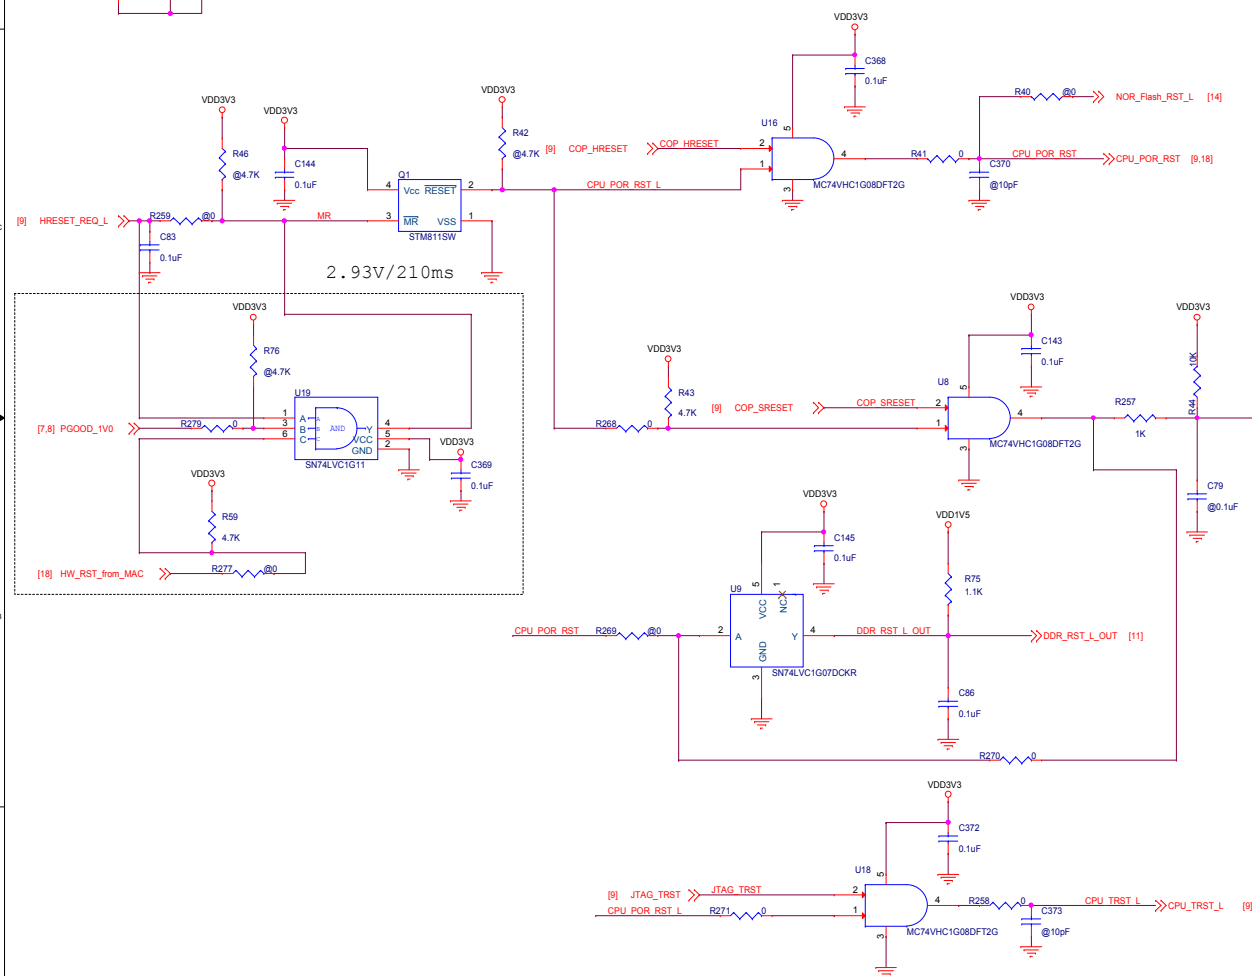

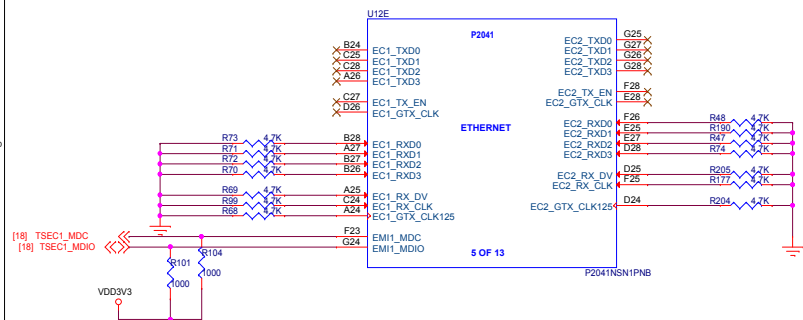

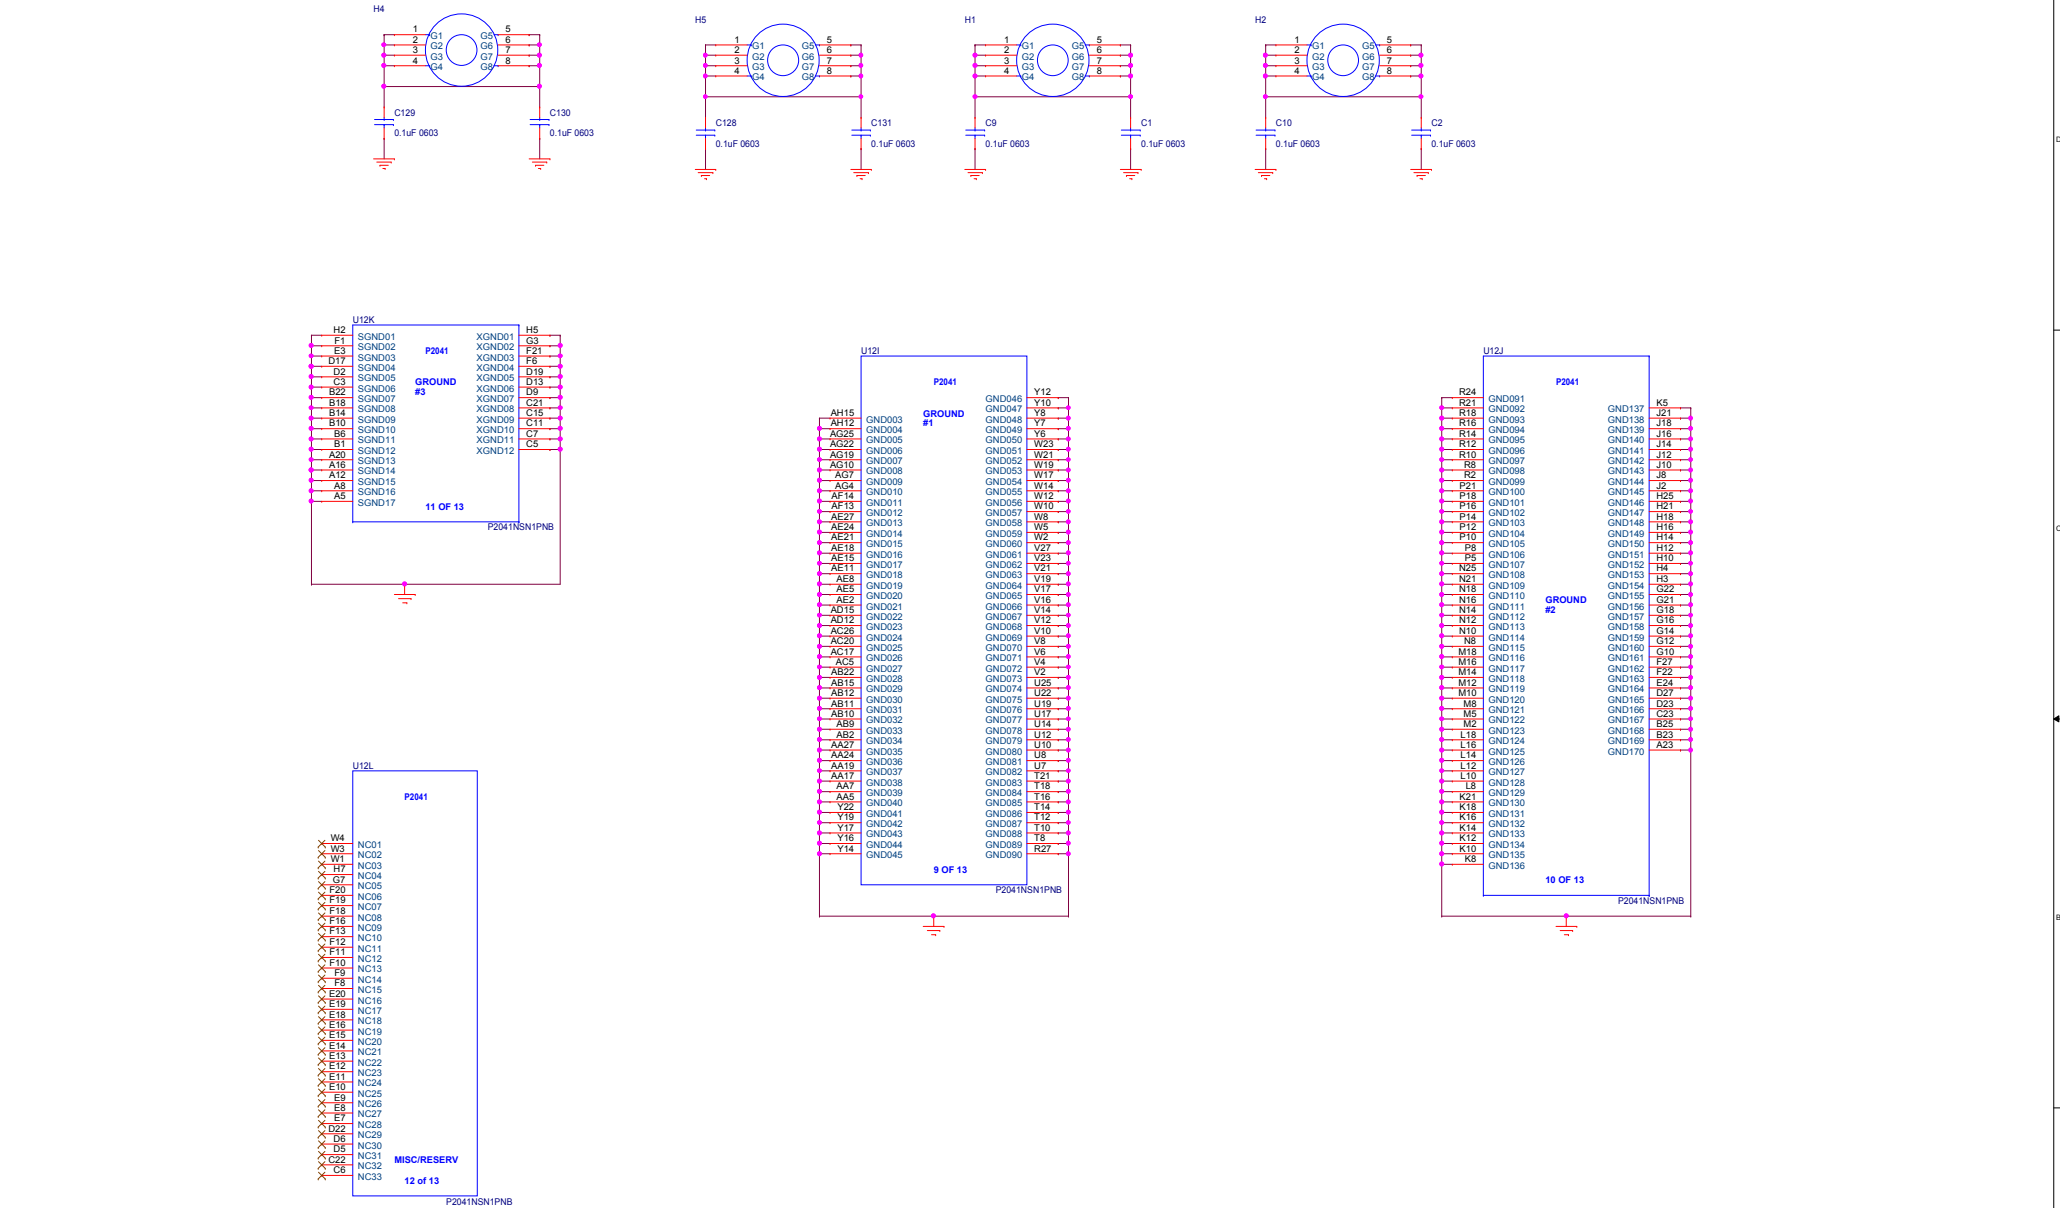

Figure 4-22. Power-On Reset Sequence

Table 16. RESET Initialization Timing Specifications

Parameter	Min	Max	Unit ¹	Note
Required assertion time of PORESET	1	—	ms	3
Required input assertion time of HRESET	32	—	SYSClk _s	1, 2
Input setup time for POR configs with respect to negation of PORESET	4	—	SYSClk _s	1
Input hold time for all POR configs with respect to negation of PORESET	2	—	SYSClk _s	1
Maximum valid-to-high impedance time for actively driven POR configs with respect to negation of PORESET	—	5	SYSClk _s	1

Note:

1. SYSCCLK is the primary clock input for the device.
2. The device asserts HRESET as an output when PORESET is asserted to initiate the power-on reset process. The device releases HRESET sometime after PORESET is negated. The exact sequencing of HRESET negation is documented in Section 4.4.1, "Power-On Reset Sequence," in the chip reference manual.
3. PORESET must be driven asserted before the core and platform power supplies are powered up. Refer to [Section 2.2, "Power Up Sequencing."](#)
