IN NO EVENT WILL OCP BE LIABLE TO YOU FOR ANY MONETARY DAMAGES WITH RESPECT TO ANY CLAIMS RELATED TO, OR ARISING OUT OF YOUR USE OF THIS SPECIFICATION, INCLUDING BUT NOT LIMITED TO ANY LIABILITY FOR LOST PROFITS OR ANY CONSEQUENTIAL, INCIDENTAL, INDIRECT, SPECIAL OR PUNITIVE DAMAGES OF ANY CHARACTER FROM ANY CAUSES OF ACTION OF ANY KIND WITH RESPECT TO THIS SPECIFICATION, WHETHER BASED ON BREACH OF CONTRACT, TORT (INCLUDING NEGLIGENCE), OR OTHERWISE, AND EVEN IF OCP HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGE.

2. Table of Contents

3. Scope

This document defines the technical specifications for the RunBMC used in Open Compute Project.

4. Overview

This document describes the RunBMC daughter board card design for use with Open Compute Project motherboards. This specification defines the interface between the Baseboard Management Controller(BMC) subsystem and OCP hardware platforms, such as network or compute motherboards.

The RunBMC daughter board interfaces with hardware platforms through a 260 pin SODIMM DDR4 connector, which is intended for mounting into a mating SODIMM DDR4 socket.

Figure 4-1 shows an example of RunBMC daughter board I/O connectivity

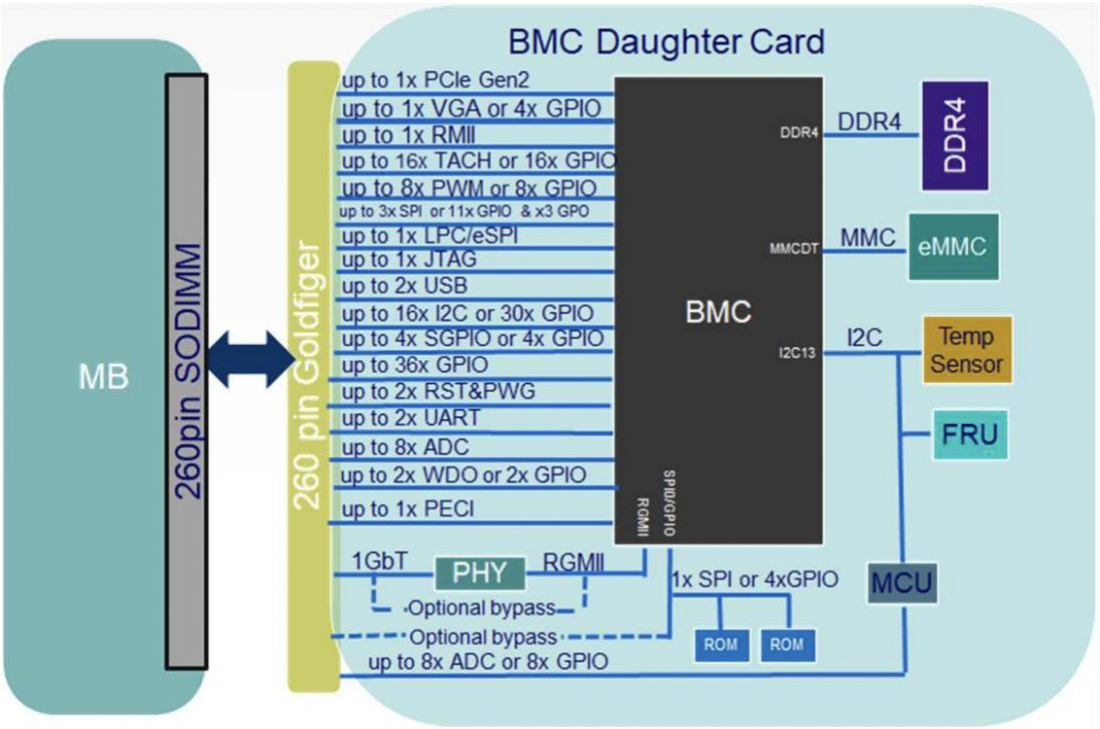

Figure 4-1

5. BMC Daughter Board Signaling Interface

5.1 Signal Function Groups

Signal function groups can be summarized in Table 1.

Function	Signal Count for Interface	Number of Interfaces	Number of used pins
Form Factor - 260 SO-DIMM4			
Power 3.3V			5
VDD_RGMII_REF			1
LPC 3.3v or ESPI 1.8v			1
Power 12 V			1
Ground			38
ADC	1	8	8
GPI/ADC	1	8	8
PCIe	7	1	7
RGMII/1GT PHY	14	1	14
VGA / GPIOs	7	1	7
RMII/NC-SI	10	1	10
Master JTAG/GPIO	6	1	6
USB host	4	1	4
USB device	3	1	3
SPI1: SPI for host - quad capable	7	1	7
SPI2: SPI for host	5	1	5
FWSPI: SPI for Boot - quad capable	7	1	7
SYSSPI: System SPI	4	1	4
LPC/eSPI	8	1	8
I2C / GPIOs	2	12	24
GPIOs / I2C	2	3	6
I2C	2	1	2
UARTs (TxD, RxD)	2	4	8
CONSOLE (Tx, Rx)	2	1	2
PWM	1	8	8
Tacho/GPIOs	1	16	16
PECI	2	1	2
GPIOs	1	37	37
GPIO/GPIO Expanders (Serial GPIO)	4	1	4
Reset and Power Good	1	2	2
Watchdogs/GPIO	1	2	2
BOOT_IND# / GPIO	1	1	1
RESERVED/KLUDGE	1	2	2

Table 1

5.2 Signal Requirements and Descriptions

5.2.1 Power

For all power requirements (red cells highlighted Table-1), please reference “Electrical and Timing Requirements”.

5.2.2 ADC

The Interface has 16 voltage sensing channels available to use. 8 of these are primary functional as ADC. The remaining 8 primarily function as GPI (General Purpose Input) but may be configured as ADC if desired.

5.2.3 PCIe

The PCIe connection supports a PCI-Express Gen 2 One Lane (x1) connection.

5.2.4 Ethernet and RGMII

The interface shall allow flexibility for an Ethernet interface as primary function as shown below in “1GbT Interface”. Secondary functionally I/O’s allow for a RGMII interface to be routed over the connector if desired as shown in the “RGMII interface”.

The RunBMC interface allows designers to use PHYs that have different I/O voltage requirements than what the BMC SoC can drive natively. VDD_RGMII_REF, an output reference voltage, can be used to accomplish these types of scenarios. Please see section 6 for electrical guidelines.

Section 10 highlights platform guidelines and usage for VDD_RGMII_REF signal.

1GbT usage	RGMII usage
	

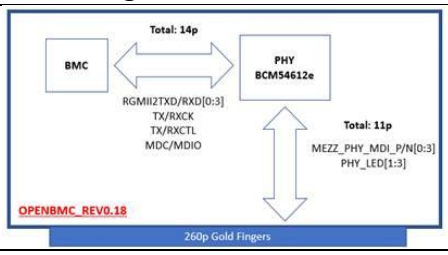

Table 2 - 1GbT Interface vs RGMII usage

5.2.5 VGA

The following pins provide VGA functionality:

Signal Name	Description
DACB	DAC B channel output
DACG	DAC G channel output
DACR	DAC R channel output
DDCCLK_GPIO	VGA DDC clock pin
DDCDAT_GPIO	VGA DDC data pin
VGAHS_GPIO	VGA horizontal sync output
VGAVS_GPIO	VGA vertical sync output

Motherboard designer should ensure proper RGB terminations and filtering based on RGB trace impedance.

Two 150R terminations should be present in VGA trace:

- One 150R should be close to SOC that is on the RunBMC module.
- One 150R should be close to filter on the Motherboard.
- System designers should reference their BMC vendor design guide for further recommendations.

Figure 5-1 shows the recommended topology.

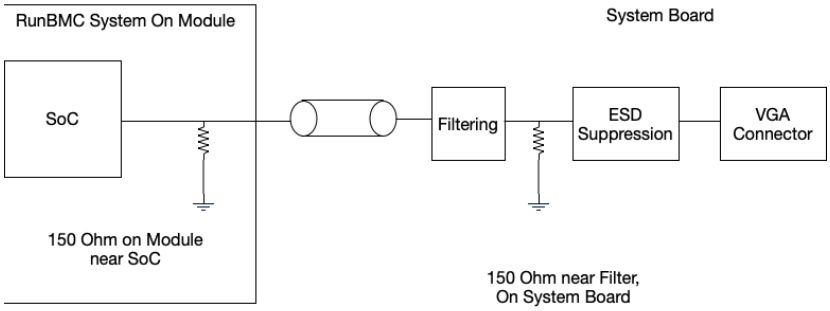

Figure 5-1

5.2.6 RMII/NC-SI

RMII/NC-SI is provided through a single interface. MDC and MDIO signals are also routed over the connector specific to this interface.

5.2.7 JTAG

Interface defines a single JTAG, which is meant to act as a master. The typical 5 signals are defined including RTCK as a sixth signal not typically used in master applications.

Signal Name	Description
JTAG1TRST	Defines Test Reset, output from BMC
JTAG1TMS	Test Mode Select, output from BMC
JTAG1TDO	Test Data Out, input to BMC
JTAG1TDI	Test Data In, output from BMC
JTAG1TCK	Test Clock, output from BMC
JTAG1RTCK	Return Test Clock, input to BMC (if used)

5.2.8 USB2A Host/Device

The USB2A interface has the host and device functionality. Two additional signals for USB is included, which are optional.

Signal Name	Description	Notes
USB2AVBUSOVC	Host/device Overcurrent sense	Over-current interrupt input from motherboard to detect if a USB device powered by the motherboard and attached to the BMC exceeds the specified current for the USB port.
USB2AVBUSC	Host/device VBUS Control	Output to control 5V supply to USB device. In the case that the USB Device attached to the BMC

		enters an over-current state (as indicated by USB Over Current Sense) the BMC will de-assert this signal and 5 V supply to the USB device will go into a low voltage or low current state, such that the device will no longer have power.

5.2.9 USB2B Device

The USB2B interface has USB device capability. One additional signal for USB is included, which is optional.

Signal Name	Description	Notes
USB2BVBUSSNS	Device VBUS Sense	Detects 5 V supply is asserted and allows the BMC to have its device port begin USB host negotiation. Note that use of the 5 V supply detect is meant to indicate to the BMC as a device that a host is attached and supplying power.

5.2.10 Firmware SPI

The BMC boots from a flash memory device located on the Serial Peripheral Interface (SPI) bus. The device size is 256Mb (32MB) minimum and can be used to store FPGA, CPLD, and miscellaneous recovery images.

A secondary device is supported to provide BMC recovery and firmware updates, which can be used by the extra chip select. The daughterboard can have these onboard or utilize the secondary function signal pins over the connector if placement on the baseboard is mandatory. Refer to Signal Priority and Nomenclature section of this specification.

5.2.11 SPI Master Interface for Host

Three additional Serial Peripheral Interface (SPI) Master Controller interface signals are routed over the connector. Two busses provide two chip selects used to select the primary or secondary SPI Flash device's if used. The remaining bus (SYSSPI) only has 1 chip select.

All SPI Host interfaces are multiplexed with GPIOs.

SPI	Net Name	Quad SPI Support[1]	CS
Firmware/Boot SPI	FWSPI*	Y	2
Host SPI Interface 1	SPI1*	Y	2
Host SPI Interface 2	SPI2*	N	2
System SPI	SYSSPI*	N	1

1. Quad SPI is supported by the RunBMC interface but not guaranteed by the SoC

5.2.12 LPC/eSPI

The Low Pin Count (LPC) interface used by most systems to provide communication up to the host is provided; some future systems are designing towards the eSPI specification. Eight pins of the RunBMC connector can be exclusively used for one of these two interfaces.

Signal voltage levels are defined by VDD_LPC3V3_ESPI1V8 signal. Please reference section 6 for electrical requirements.

5.2.13 I2C

The interface features multiple I2C Bus compatible 2-wire interfaces consisting of a serial data line (SDA) and a serial clock line (SCL). If the daughterboard contains drives that are open-drain, the baseboard device shall require a pullup resistor to generate a logic high voltage and shall remain high even when the bus is idle.

Proper power domain isolation shall be implemented on the daughterboard. The AC/DC specifications are defined in the SMBus 2.0 and I^2C bus specifications.

5.2.14 UART

5 total UART interfaces are available to use. 3 UART interfaces are expected to be primary functioning and 2 are available if daughter board supports functionality. 1 UART is to be named CONSOLE for default BMC console output if desired.

UART	Net Name	HW Flow Control Capable
Default Console	CONSOLE*	N
UART[1-4]	UART[1-4]*	N

5.2.15 PWM

PWM output from BMC, meant to drive fans or pumps. It is expected that these signals have whatever necessary level conversion on the baseboard. It is the responsibility of the motherboard designer to add circuitry to properly isolate the BMC signals from the fans or pumps being controlled.

5.2.16 TACH

Tachometer input to BMC. It is expected that these signals have whatever necessary level conversion before going over the interface. It is the responsibility of the motherboard designer to add circuitry to properly isolate the BMC signals from tachometer signals being read from fans or pumps.

5.2.17 PECI

An Intel proprietary bus meant to read die temperature. This defines two pins, PECI and PECIVDD. PECI is a 1-wire data signal that acts as bi-directional signal to the BMC. PECIVDD is the host voltage that defines a reference for the PECI interface.

5.2.18 GPIO / GPO / GPI

Any GPIO is defined in the literal sense that it may be used for the purpose of defining an input or output signal to the BMC. These are software configurable for use throughout the baseboard as indicators, control pins, interrupts, and input logic read by the BMC. In the case of GPI and GPO, these pins are fixed as input and output respectively.

5.2.19 SGPIO

SGPIO is the Serial GPIO interface. The HW Interface describes a single Serial GPIO Master, though in some modules this may also act as a slave monitor. There are four signals defined as master:

Signal Name	Description
SGPMCK	Master Serial GPIO Clock Output, controlling clock for the bus, output from the BMC
SGPMI	Master Serial GPIO Serial Data Input, an input to the BMC
SGPMLD	Master Serial GPIO Serial Data Load, an output from the BMC
SGPMO	Master Serial GPIO Serial Data Output, an output from the BMC

5.2.20 RESET and POWERGOOD

Reset signal is an active low input to the BMC, this pin will reset the BMC subsystem. PWRGD is an input to the BMC; used for high priority interrupt and status derived from power supply status.

5.2.21 WATCHDOG

Two Watchdog resets, which are output signals, are used to reset system components. For example, this signal can be used to reset a TPM in the scenario of a watchdog timeout on the BMC so that the system reboots properly.

5.2.22 INDICATOR

This defines generic indication from the module to the system. The use of this pin is dependent on the BMC module used, so consult specific documentation for that module.

5.2.23 Reserved/KLUDGE

Two KLUDGE pins are reserved for future use. Secondary functions support GPIO.

5.3 Pin Definition

The BMC daughter board shall have the following pinout:

Table 3 BMC connector/edge pinout

Pin #	Name	Name	Pin #
1	VDD_12V_STBY	VDD_RGMII_REF	2
3	VDD3_3V_STBY	VDD3_3V_STBY	4
5	VDD3_3V_STBY	VDD3_3V_STBY	6
7	VDD3_3V_STBY	GND	8
9	GND	DACG	10
11	GND	DACB	12
13	GPIO0_SGPMLD	DACR	14
15	GPIO1_SGPMI	VGAHS_GPIO2	16
17	GPIO3_SGPMO	VGAVS_GPIO4	18
19	GPIO5_SGPMCK	DDCCLK_GPIO6	20
21	CONSOLERX	DDCDAT_GPIO8	22
23	CONSOLETX	GND	24

5.4 Signal Priority and Nomenclature

The BMC pinout specification outlines the functions of the physical pins. To allow for system flexibility many of the pins in the interface must be capable of dual-function; i.e. they must provide capability for both functions.

Most of these dual function pins are achieved through multiplexing, however some pins only have a singular function. The direction column's origin is the SOC on the RunBMC module, i.e. "output" signals are driven from the SOC over the connector.

Functions	Net Name	Function 1	Function 2	Direction	Description Function 1	Description Function 2
1 GbT/RGMII/GPIO	GPIO_RGMIIRXCK	GPIO	RGMIIRXCK	BI	GPIO	**RGMII 2 receive clock**
1 GbT/RGMII/GPIO	PHYLED1_RGMIITXCK	PHYLED1	RGMIITXCK	BI	GPIO intended for MAGJACK LEDs, or signal from PHY	**RGMII 2 transmit clock**
1 GbT/RGMII/GPIO	PHYLED2_RGMIIRXCTL	PHYLED2	RGMIIRXCTL	BI	GPIO intended for MAGJACK LEDs, or signal from PHY	**RGMII 2 receive control**
1 GbT/RGMII/GPIO	PHYLED3_RGMIITXCTL	PHYLED3	RGMIITXCTL	BI	GPIO intended for MAGJACK LEDs, or signal from PHY	**RGMII 2 transmit control**
1 GbT/RGMII/GPIO	GPIO_RGMIIMDC	GPIO	RGMIIMDC	OUTPUT	GPIO	**Management Data Clock. The MDC clock input must be provided to allow MII management functions.**
1 GbT/RGMII/GPIO	GPIO_RGMIIMDIO	GPIO	RGMIIMDIO	BI	GPIO	**Management Data I/O. This serial input/output bit is used to read from and write to the MII registers**
1 GbT/RGMII/GPIO	TRD0N_RGMIIRXD0	TRD0N	RGMIIRXD0	BI	Transmit/Receive Pair 0	**RGMII 2 receive data bus from PHY bit 0**
1 GbT/RGMII/GPIO	TRD0P_RGMIITXD0	TRD0P	RGMIITXD0	BI	Transmit/Receive Pair 0	**RGMII 2 transmit data bus to PHY bit 0**
1 GbT/RGMII/GPIO	TRD1N_RGMIIRXD1	TRD1N	RGMIIRXD1	BI	Transmit/Receive Pair 1	**RGMII 2 receive data bus from PHY bit 1**
1 GbT/RGMII/GPIO	TRD1P_RGMIITXD1	TRD1P	RGMIITXD1	BI	Transmit/Receive Pair 1	**RGMII 2 transmit data bus to PHY bit 1**
1 GbT/RGMII/GPIO	TRD2N_RGMIIRXD2	TRD2N	RGMIIRXD2	BI	Transmit/Receive Pair 2	**RGMII 2 receive data bus from PHY bit 2**

1 GbT/RGMII/GPIO	TRD2P_RGMIITXD2	TRD2P	RGMIITXD2	BI	Transmit/Receive Pair 2	**RGMII 2 transmit data bus to PHY bit 2**
1 GbT/RGMII/GPIO	TRD3N_RGMIIRXD3	TRD3N	RGMIIRXD3	BI	Transmit/Receive Pair 3	**RGMII 2 receive data bus from PHY bit 3**
1 GbT/RGMII/GPIO	TRD3P_RGMIITXD3	TRD3P	RGMIITXD3	BI	Transmit/Receive Pair 3	**RGMII 2 transmit data bus to PHY bit 3**
1.8V or 3.3v	VDD_RGMII_REF	VDD_RGMII_REF		Output	Reference voltage output for PCB	none

Table 4 BMC functions

6. Electrical and Timing Requirements

6.1 Electrical Requirements

DC Electrical Requirements	Requirement	Notes
Current carrying capability at 30 °C temperature rise per contact	0.50 amp/pin De-rated	Electrical Requirements shall meet PS-003A-01 JEDEC specification

Power and Ground Requirements	Pin Count	Description	Maximum Current/Power
VDD_12V_STBY	1	+12V main or +12v aux	0.5amps/6watts
VDD3_3V_STBY	5	+3.3V main or +3.3 aux	2.5amps/8.25watts
GND	38	Ground Return	

Signal Requirements	Description	Notes	Typical
I2C	I2C serial data (SDA) and serial clock (SCL) signals.	Pullups should be placed on System Board.	3.3V
RGB			
TACH	Fan Tachometer Controller	Tachometer Input	3.3V
PWM	Pulse Width Modulation	Output	3.3V, 8mA drive strength
RGMII	Reduced Gigabit Media Independent Interface	If lower voltages are desired (ex: 1.8v), the RunBMC daughterboard must translate to 3.3V. VDD_RGMII_REF can be used as a reference voltage to translate.	3.3V or 1.8V, i.e. VDD_RGMII_REF
ADC	Analog to Digital Converter	Inputs are reference to 1.8v (ADC0-15)	1.8V
ESPI or LPC	Enhanced Serial Peripheral Interface Bus or Low Pin Count Interface	Voltage is selectable by VDD_LPC3V3_ESPI1V8 voltage pin.	3.3V or 1.8V
VDD_RGMII_REF	Voltage reference output	For scenarios where BMC's have different RGMII voltage IO requirements. This signal can be referenced on the MB for 1v8 or 3v3 I/O references. See figure 6.1 for an example.	Up to designer.

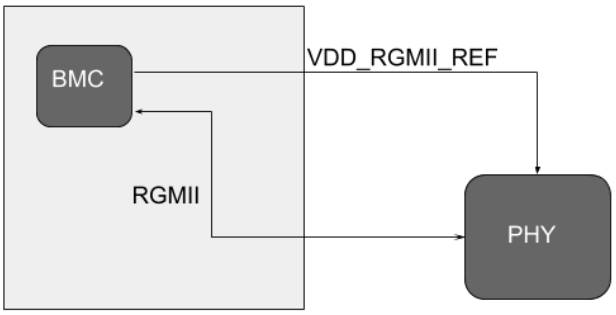

Figure 6-1

Figure 6-1 is an example of VDD_RGMII_REF driving a voltage reference pin in the case where the BMC vendor has specific RGMII voltage requirements. For example, 1v8 HSTL vs 3v3 TTL.

6.2 Timing Requirements

Below are general recommendations for motherboard designer to consider.

Skew Requirements	Requirement	Notes
PCIe	Trace length < 17". Intra pair skew less than 3mil	Condition based on middle loss material for PCB design
USB	Trace length < 17". Intra pair skew less than 2mil	Condition based on middle loss material for PCB design
1GbT	Intra pair skew less than 2mil	Length follow PHY controller requirement with 0.5" length reduction.
RGMII	Group signal (TX and RX) skew less than 50mil	
VGA	Group signal (TX and RX) skew less than 30mil	
RMII/NC-SI	Group signal (TX and RX) skew less than 200mil	
LPC	Group signal skew less than 250mil	
SPI	Group signal (TX and RX) skew less than 100mil	

7. Mechanical

7.1 Form Factor

The BMC module shall conform to the 260 Pin DDR4 SODIMM, .50mm Pitch DIMM Registration form factor, defined by MO-310C, with the exception of the height and component height keepout requirements. The module has a 260 pin edge connector. Refer to JEDEC spec for dimensions and tolerances. The following heights are supported per below table.

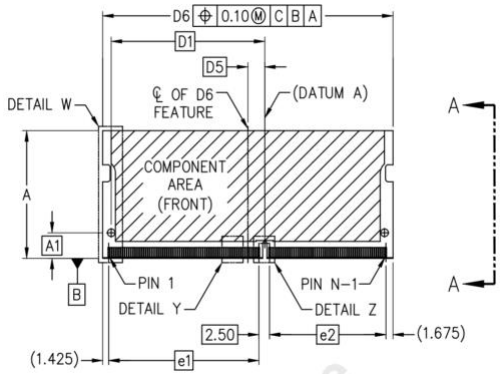

Figure 7-1

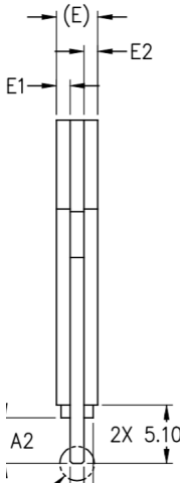
Figure 7-1 outlines the SO-DIMM DDR4 JEDEC registration. RunBMC will follow this registration, with the exceptions to the "A" height. The below table shows the permissible A heights.

Card Types	"A" height denoted in Figure 7-1
Standard	32mm
Large	50mm

7.2 Component Height Keep-out Requirements

Reference boards should have major components on the top side of the PCB, referenced by E1 in Figure 7-3 below. Smaller components with low height can be placed on the bottom, E2.

When placed in a right-angle configuration, E1 will face towards the top of the compute or network platform.



Dimension for Figure 7-3	mm	Notes
E1 (top)	5.44mm	Right Angle config. This is the top of the PCB
PCB thickness	1.2mm	PCB material thickness
E2 (bottom)	1.6mm	Right Angle config. This is the bottom of the PCB

Figure 7-2 BMC Thickness

The below figure demonstrates a right angle SO-DIMM connector of 8mm height.

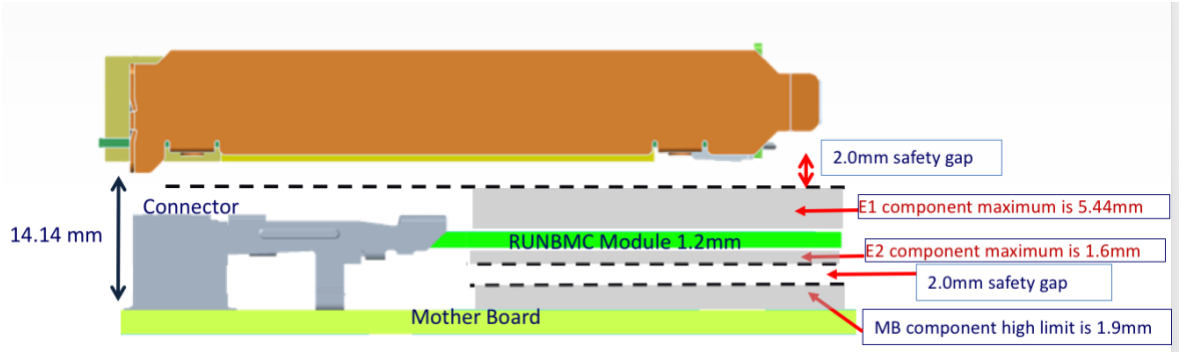


Figure 7-3

7.3 RU/OU Mounting Options

- System Height = 1OU/1RU:
  - *Standard* vertical card supported.
  - Right-angle for *Standard* or *Large* supported.
- System Height > 1OU/1RU:
  - *Standard* and *Large* supported in vertical or right-angle.

7.4 Mating Connector

The BMC mating connector shall conform to the DDR4 Small Outline Dual Inline Memory Module (SODIMM), 260 pin, 0.50 mm pitch Socket Outline, defined by SO-018D.

A conforming vertical connector, Amphenol G634B2610X22HR, or equivalent can be mounted on the motherboard or network device, to mate with the BMC module edge connector. Right Angle or Angled connectors are permissible if conformant to SO-18D specification.

8. Thermal

The BMC mezzanine card can be located in any position of the server or network motherboard. The worst-case environmental conditions should be simulated by system designer. The thermal solution, component selections, and system design should consider for these conditions. Below is the thermal boundary condition table:

Hot Aisle Air Temperature Boundary Conditions	**Low**	**Typical**	**High**	**Max**
Local Intel Air Temperature	5°C(system Inlet)	55°C	60°C	65°C
Hot Aisle Airflow Boundary Conditions	**Low**	**Typical**	**High**	**Max**
Local Inlet Air Velocity	100LFM	200LFM	350LFM	System Dependent
Cold Aisle Air Temperature Boundary Conditions	**Low**	**Typical**	**High**	**Max**
Local Intel Air Temperature	5°C	25°-35°C ASHRAE A1/A2	40°C ASHRAE A3	45°C ASHRAE A4
Cold Aisle Airflow Boundary Conditions	**Low**	**Typical**	**High**	**Max**
Local Intel Air Velocity	100LFM	150LFM	250LFM	System Dependent

9. FRU Requirements

It is recommended to use a minimum size of 2kB for EEPROM.

FRU Requirements	Description	Location	I2C BUS	I2C address
I2C Identification EEPROM. Identification field can be programmed in “M/B Custom Field 1”	EEPROM used for FRU data, system purposes, identification. Motherboard designers should allow access for the HOST SMBus to access identification FRU on I2C BUS 13.	RunBMC	13	0XA2, 8bit
I2C Personality EEPROM	EEPROM used by SOC to define personality of system	System Board	4	0xA0, 8bit

Please reference IPMI V2.0 Spec, Table 11-1 Board Info Area, for EEPROM identification field.

10. Platform Guidelines

- BMC programmers should be advised to create a software abstraction layer. This layer will help map the RunBMC connector pinout to SOC pins specific to the vendor module.
- VDD_RGMII_REF is intended to be used as a reference voltage, which is provided by the RunBMC module.
    - Scenario 1: RGMII from vendorA expects 1.8v and vendorB expects 3.3v. Some PHYs allows you to set different voltages based on an IO voltage reference.
- VDD_LPC3V3_ESPI1V8 is an input to the LPC or ESPI function. LPC expects 3.3v on this signal and ESPI expects 1.8v.
